

# IUCN Category III - Natural Monument or Feature

## DEFINITION

---

Areas set aside to protect a specific natural monument, which can be a landform, sea mount, submarine cavern, geological feature such as a cave or even a living feature such as an ancient grove.

## MAP

---

IUCN and UNEP-WCMC (2014). The World Database on Protected Areas (WDPA). October 2014. Cambridge, UK: UNEP-WCMC

## DESCRIPTION

---

IUCN Management Category III (Natural Monument or Feature) refers to small-sites that focus on one or more prominent natural features and the associated ecology, rather than on a broader ecosystem. They are defined by IUCN as “*areas set aside to protect a specific natural monument, which can be a landform, sea mount, submarine cavern, geological feature such as a cave or even a living feature such as an ancient grove* They are generally quite small protected areas and often have high visitor value”.<sup>1</sup> The primary objective of

protected areas in this category is to protect specific outstanding natural features and their associated biodiversity and habitats. Other objectives include to provide biodiversity protection in landscapes or seascapes that have otherwise undergone major changes and to conserve traditional spiritual and cultural values of the site.

#### SUPPORTED BY

---

Developed by the International Union for Conservation of Nature (IUCN) with support of the World Commission on Protected Areas (WCPA) and other international institutions such as the Convention on Biological Diversity (CBD), and assigned by national governments.

#### YEAR OF CREATION

---

The current IUCN Categories were approved in 1994, and revised guidelines were published in 2008.<sup>[1](#)</sup>

#### COVERAGE

---

Globally applicable.

#### CRITERIA

---

Category III protected areas are usually relatively small sites that focus on one or more prominent natural features and the associated ecology, rather than on a broader ecosystem. Category III protected areas could include:<sup>[1](#)</sup>

- Natural geological and geomorphological features: such as waterfalls, cliffs, craters, caves, fossil beds, sand dunes, rock forms, valleys and marine features such as sea mounts or coral formations;
- Culturally-influenced natural features: such as cave dwellings and ancient tracks;
- Natural-cultural sites: such as the many forms of sacred natural sites (sacred groves, springs, waterfalls, mountains, sea coves etc.) of importance to one or more faith groups;
- Cultural sites with associated ecology: where protection of a cultural site also protects significant and important biodiversity, such as archaeological/historical sites that are inextricably linked to a natural area.

The term “natural” as used here can refer to both wholly natural features (the commonest

use) but also sometimes features that have been influenced by humans.

## MANAGEMENT

---

These areas are managed to maintain certain natural features, and this can be carried out by a range of actors depending on the governance type of the area (see [Protected Areas](#) for information on governance types). These areas are generally managed in much the same way as a category II area but at a smaller-scale. Visitation and recreation is often encouraged, as well as environmental education.

## BUSINESS RELEVANCE

---

**Legal and compliance** – The classification of a Category III protected area requires that such areas are managed for conservation by legal or other effective means, and therefore legal recognition and protection at the national or sub-national level is likely to be present in these sites. The level of legal protection will however vary between countries, and will depend on the governance type of the area, as they receive differing levels of recognition by government in different countries. Nonetheless a number of national laws are likely to apply to these sites that deter large-scale economic activities in order to maintain the conservation values of these areas.

As designated protected areas, these sites receive international attention and have been incorporated into a number of environmental safeguard standards. These include those of multilateral financial institutions such as but not limited to the World Bank<sup>2</sup> and the International Finance Corporation<sup>3</sup>. For details on environmental safeguard standards which are applicable to all protected areas, please see the [Protected Areas](#) page.

In addition, a number of sector specific safeguard standards refer to protected areas, many of which are related to certification programs, including the Roundtable on Sustainable Biomaterials (RSB) that declares categories I to IV as 'no-go' areas.<sup>4</sup> For details on certification programmes which are applicable to all protected areas, please see the [Protected Areas](#) page.

**Biodiversity importance** – The main emphasis of protection in category III areas is on the natural features found in these sites. Their role in the conservation of species and habitats, hence, varies. In some cases their contribution to biodiversity conservation may be indirect result of protection of natural features. In other cases (e.g. natural cave system) they may play a key role in the wider conservation strategy of an area. Category III is similar to category II and managed in much the same way but at a rather smaller-scale and with less complexity of management.

**Socio-cultural values** – Category III areas are likely to hold socio-cultural values as they may have features such as sacred groves, springs, waterfalls, mountains, sea coves etc. of importance to one or more faith groups. These areas are often of significant tourism value and can be managed with the objective of promoting sustainable tourism.

## Tools

[Protected Planet](#) a tool for visualizing information on protected areas at the site level, country level, regional level and global level. This includes information on the IUCN category where known. Protected Planet brings together spatial data, descriptive information and images from the World Database on Protected Areas, WikipediaTM and PanoramioTM.

[Integrated Biodiversity Assessment Tool \(IBAT\) for business](#) provides a visualisation and GIS download tool for protected areas, including the IUCN category where known.
